Thread: [Python script to find arbitrage opportunities \(Win-Win betting\) - FREE / OPEN SOURCE](#)

pstefa1707 - April 22, 2019, 10:52 pm

I made a python script to find arbitrage betting opportunities, it may not be the prettiest or stable by any means, but hey, it works!

Let me know what you guys think, first time using hack forums, wasn't sure where to make this post (let me know if its in the wrong section).

How to use:

Wait for script to load chrome driver, dont touch anything.

Enter the amount you wish to invest (used for calculations)

Enter pages to scan (I would recommend staying below 50ish, usually I do around 10)

Close all ads or popups on the browser.

Let the script work it's magic :)

I can't post links as I dont have enough posts, my github is (take out spaces):

[https: // github.com/ pstefa1707](https://github.com/pstefa1707)

You mention the site at least in your post. I will try it out but not quite understanding what you mean by 50ish

It bugs out after scanning 69 pages. The more pages you do the longer it takes to scan and thus by the time it's done scanning the arb opportunities in the starting pages are lost.

Ben Indangasy - September 29, 2019, 8:48 am

am interested in this code...

Balenci - September 29, 2019, 11:58 am

very interested as well!!!!!!
