Thread: [FTP Hack](#)

sitdown1 - April 25, 2019, 10:06 am

Okay guys,

soo i need some help here!

I bought some software a while back and to use it you get a command prompt.exe written in C++, VS. you need to enter a token / licence. Once you have you can then select the software, it will download from a FTP into temp folder, inject and then auto delete.

I managed to find out what server it is talking to (i now have the IP) and i have also found the dir where some of the files are kept (on the desktop).

Is there anyway to download these files so i can "run" or create a C++ program that does the same as the current one but without the need to use a token / licence every 24 hours!?

I would be grateful if someone could help me.

i dont know if it is allowed but my discord is: Slappy #2564

Willing to pay for services / help!

I have no idea how you would ACTUALLY approach this as I am a simple man which your words humble me, but I would try to scan it looking for any outdated software and if it does have a look on exploit databases. If I find one that includes login or shell I would implement it into a shell/python script, or I would be a skid and look for an already built script.

If I find one that includes login or shell I would implement it into a shell/python script, or I would be a skid and look for an already built script. I know port 80 is open. These files it downloads, must be public as they download to over 100 computers a day (if they have a valid licence). I've tried FTP brute force but i just cant get it working. by the looks of it, its in a data server according to whois

If someone is willing to help, i would even pay for it
