Thread: [RAT with fast Remote Desktop](#)

chalaji080 - May 4, 2019, 12:53 pm

Can anybody recommend a RAT with fast remote desktop streaming? I have checked Webmonitor, # and warzone, all has lagging remote streaming. It take seconds for a single mouse click likewise keyboard. I enjoyed the speed of IM5 remote desktop until they shutdown. Please any recommendation will be appreciated.

Its not just the RD function itself, it's actually A LOT of factors. For example, you yourself have to have good internet, a good PC and a stable connection to the client. The VPN itself has to have good internet, a good server and a stable connection to the client. The client has to have good internet, be close to your/your VPN's location, a good pc, and a stable connection to the server.

I don't know any that have a decent remote desktop like IM5 but Quasar and njRAT are fast enough in my experience.

In my experience these are the 2 best remote desktops I have used within a RAT. Arguably yes AnyDesk or TeamViewer, would be better but if you are speaking in terms of RAT then these two are at the top of my list.

Perhaps speak with the developers of the tools you purchased, ask them to help debug your issues with remote desktop. It might be something as simple as your server latency.

Some other tools have just as good remote desktop, but most are either not supported by the developers anymore or the owner's have been apprehended for their illegal actions.
