Thread: [I have malware, now where to upload it without it being detected as virus?](#)

gerwin888 - May 14, 2019, 11:21 pm

I have malware, now where to upload it without it being detected as virus, so I can share the link and my victims downloading the malware?

Toast - May 14, 2019, 11:28 pm

Try zippyshare. From what I can remember it doesn't scan the file.

Nexium - May 14, 2019, 11:34 pm

Hack a host. Upload an upload form on an have a private direct link hosting.

Lynx - May 15, 2019, 2:01 am

host it on your own website maybe? Make sure you didn't use real information making the server though.

Host it on a bulletproof server and spread a redirect link to your stub hosted on your bp server.

Pm me if you bulletproof server and semi bp domains

If it was this hard that you had to create a thread about it, why not give it a shot? Its as simple as buying the cheapest server from digitalocean.com, installing apache2 and moving the file into the www directory.

Start with googling how to setup a server and where you do so (I suggest digitalocean.com). After that look up some information on how to setup a webserver on the OS you use (Ubuntu most of the time on digitalocean).

Like do you know something like zippyshare.com? Like what the dude posted as 2nd

tux1 - May 15, 2019, 2:02 pm

Another way is to zip/rar your file and put a password on it, so the file will be encrypted and won't be detected as much. Then when someone downloads it you give them the password and they can run it.

gerwin888 - May 15, 2019, 11:54 pm

So I get there is no site to upload my malware on without it being detected?

bumpiedumie bump bump bump
