Thread: [Need help with console application](#)

absojedi - May 16, 2019, 3:56 am

Hi guys! I am really new to the programming in general and I need some help. Could you give me some reliable resources which will help me create the following:

I have an assignment to create a console application (using a language of my choice) which will print letters in the form of a logo.

Example:

Spoiler [\(Click to View\)](#)

$N = 5$

```

*****_*****_*****_*****_*****_
_*****_*****_*****_*****_
_*****_*****_*****_*****_
_*****_*****_*****_*****_
_*****_*****_*****_*****_*****_
*****_*****_*****_*****_*****_*****_*****_*****_*****_*****_

```

I doesn't show very well here but these are MM. The N parameter should control how big the letters are and it MUST be an ODD number.

I guess I must have a line which will ask the user to specify N before printing the letters and create them accordingly. The N will represent the amount of * which will be at the point of the M letters on the first row.

I will appreciate any tips and resources which will help me create this. Thank a bunch!

Give [this](#) a read. It will help you learn the basics of console application development.

As for the assignment, I assume n = letter width? If so, it's fairly simple to complete this application.
