Thread: [rainbow six: siege cheat, apex legends cheat including bypass](#)

euroster - May 21, 2019, 3:09 pm

i'm gonna quit both of these games as I failed to find any fun at all with cheating in them (comes with the source)

bypass doesn't use none of that retarded public hypervisor, kernelbhop shit

contact me using pm

price: \$500 including source to both games and the driver. (\$400 r6s alone, \$300 apex alone), price is negotiable.

payment is in bitcoin, you go first or we use a mm

for any info, proof, previous work or whatever message me.

1. drivers are way more public and common than hypervisors.

2. discord isnt allowed on hf

Basic drivers that create objects that aren't backed by a valid module are common, the method I use for communication has never been used before and is pretty hard to detect, as the memory it resides in would trigger patchguard if iterated.

Also BattlEye, and EAC detect most IRP hooks, no matter how stealthy you are, even if you modify the device object's properties, the KLDR_DATA_TABLE_ENTRY properties, if you overwrite the IRP through the INIT section itself, it will still be detected, as in the end, the IRP doesn't belong to a valid module. (manually mapped driver)

Most pay-to-cheat services use pasted hypervisors (QuantumCheats, HyperCheats, ...), and take months to add support for new architectures...

Bump. I need this sold. 25chars

Luna - May 26, 2019, 5:32 am

User seems to know his shit.

GLWS ?
