How to secure our device and data in public WiFi?

ShinyThings - May 31, 2019, 2:31 pm

Basic stuff. Use a VPN. Don't log in to any important things. Be mindful pretty much

It depends how paranoid you really are.. 99.99% of time it wont be a hacker in sight. However on vacation in countrys where the goverments wants to have a prying eye on things i would have some kind of VPN.

However be aware that if you traveling to a country with a crypted disk, you wont leave the country with that disk unless you open it. That happened a friend of mine, who worked in the computer business. He traveled from China to Sweden. If you refuse the government will confiscate the laptop (if that disk is crypted)

VPN has been said before
