Thread: [Inspect Element Prevention?](#)

Money- - June 2, 2019, 7:02 am

Assuming with inspect element you can always bypass some validation forms or even modify values in hidden fields etc.

I want to ask what's the best approach in disabling or prevent inspect element on your website? Perhaps a client-side Java-Script function to disable it?

By the way people could always download your source code and save it as html and modify offline from there?

With Java-script code in preventing it but that will cause the client-side to disable Java-script on their browser and still manage to inspect element?

What's the best approach? Coding wise.

You can't, and if you feel as if modifying a simple HTML element will expose a security vulnerability in your website, you're doing something SERIOUSLY wrong.

So you disable the right-click context menu, then the user can just use the browser shortcut. Ok, now you've blocked ALL possible browser shortcuts, I can leave your website, open the debug menu, and navigate back to your site with it still open. Boom, now you're haxed.
