Thread: [Issue with WP Theme + Google Maps API](#)

Mr. Elite - June 6, 2019, 10:13 am

So, I am working on a site which uses the Google maps API heavily for its base content.

Theme I am working with:

<http://premium.themolitor.com/?theme=thenavigator>

Going by general setup, I have generated a Google Maps Java API key as required by the theme and implemented it in to the sites configuration.

The problem I am receiving is, there are instances of the map simply not loading, and when I input direct locations/markers, the map just gets even weirder, does not display map, does not show locations, etc.

I am hoping there is someone around who can give me a hand in fixing this issue. I have contacted support for this issue, but the guy is notorious to either replying weeks later, or not at all.

Thanks.

Well, I am short a few posts to make PMs as of yet, and its not my desire to spam to get there.

the site is <https://shtf.silentsyndicate.org>

Again, as you likely will see, it will display the generic map, but if you click lower right + option and go to the one entry Ive made as a test, once I put in lag/long, its like totally blank...

hmm i cant see the problem you are talking about. for me nothings loadin https, I think you see a cached result in your browser.

1.HTTPS. Blocked loading of mixed active content.

When you use HTTPS you need to load all extra scripts från https to but you are loading the google map script from <http://maps.go...>

But if i visit the site in http i see the map and works for me both in chrome and firefox. but no markers.

Everything looks perfectly fine if you don't use SSL.

Perhaps try installing a plugin for SSL integration. 'Really Simple SSL' is a good one.

Copperx - June 8, 2019, 1:38 am

Add Really Simple SSL plugin
or
Configure your API with/without https

Gonna give that a shot.. totally did not think about this honestly.. lol

Thanks folks, will update with results.
