Thread: [\[Twitch.tv\] Custom High Performance Live Viewer Bot Source Code \(Python\)](#)

redpanda139 - June 9, 2019, 8:07 am

Hi all,

I spent about 50 hours creating a new Twitch.tv live viewer bot in Python 3.7. This was more of a test than trying to create something sellable, but over time I realized people would find this valuable so I turned it into a very usable script. The bot is written from scratch and using the fastest possible methods. That being said it has worked recently but Twitch does move fast, there is no guarantee this will work forever or even tomorrow but the way the viewing technique is done, is to mimic a real live viewer so I would bet this technique is going to work for a long time.

Details about the bot:

The bot is capable of delivering up to ~20k viewers concurrently on a single VPS machine (~40\$/month on DigitalOcean) with a specific residential proxy provider (75\$/month). I have fine tuned the script to run be extremely efficient with system resources so that the cheapest VPS on the market can deliver great results. You can also run it on your personal computer if you like since it uses proxies. All viewers are proxy IPs meaning the viewers do not show up in the user viewer list but can easily boost a channel up 5k+ for a sustained amount of time (forever). The bot uses proxies that rotate so the chance of getting caught is close to none. The bot uses a proxy provider that has many countries available so you can pass in a list of countries or default to any country via command line.

The bot has the following command line options:

-- channel: twitch.tv channel

-- viewers: # of live viewers desired

(there are more options that I can reveal once you buy the script, but it basically allows fine tuning of the performance and behavior of the script to what you want).

Twitch does not allow viewer bots like this on the platform so I am merely selling the script and how to set it up, I do not endorse using this or creating a business off of this script. I am not responsible for what you do with the script.

That being said, I am looking to sell my work and a setup guide that I wrote to help you get started. This will include:

- Live viewer python script (Python 3.7+) (latest Python for performance reasons)
- Requirements.txt for Python dependencies
- Bash script to install all dependencies for an Ubuntu 19.04 machine
- Answer any questions you might have about the code (why things are coded the way they are, etc) solving any issues you run into until its setup (easy setup)

I am looking for serious buyers only. I prefer people who are looking to make a business AND know how to code (python preferred), since the script can easily be built upon to scale to even more viewers. I do not plan on selling to people who aren't technical enough to handle it, since that will require even more support from my side.

Willing to run a vouch test on a channel for a trusted user only, since this is a fresh HF account. They can report back the results and we can go from there.

I am looking for \$1000 in BTC that can go through escrow for the script. Selling limited number of copies or if someone wants to take it for themselves forever, I am willing to sell only once for a higher price.
