Thread: [root my Samsung s7, how?](#)

likne4 - June 9, 2019, 5:51 pm

Yes i know Google, but there seem to be different says to do it depending on what model you have.

So i hope someone in here can help.

Model: sm-g930f(heroltexx)
RIL version: Samsung RIL v4.0
Baseband version:g930fxxu4esae
Build number: r16nw.g930fxxs4esb1
Os version: O (8.0.0)

so look up a way to root your model?
literally what are you doing

1. Download USB Drivers in your computer.
2. Reboot the PC.
3. From settings > Info of the device > Build Version (tap multiple times to get on the developer mode).
4. Setting> Developer options > Activate debug USB and OEM unlock.
5. Download the files for you device (sm-g930f)
https://download.chainfire.eu/929/CF-Root1/CF-Auto-Root-herolte-heroltexx-smg930f.zip?retrieve_file=1

Then use the usual way to flash the file on your device through Odin.

I suggest Magisk.
