Thread: [EMAIL SORTER NEEDED. +EASY TO EDIT+](#)

zelus - June 13, 2019, 5:56 pm

Just as the Title said.

Am looking for an email sorter coded in Python.

The emails will be sorted based on their MX records.

There are already apps for this but the number of domains is mostly limited.

So I need what adding domains into it will not turn to rocket science.

If you can do this, just comment on what exactly you can do and maybe price.

I will contact via PM.

Do not ask me for my budget as some of these cost \$20.

Does not mean my budget is \$20 though.

Hey, I can do this for you easily and fast, maybe you can add email addresses in a txt file and the script will output sorted mx, is that you want?

Someone has already done it for me. But if you can do it and it's different from what I have, I will pay you too.

Code def main():

 f = open("mails.txt", "r")

 if f.mode == "r":

 content = f.read()

 sorted_list = sorted(content.split(), key=lambda x: x.lower().split('@')[1])

 for item in sorted_list:

 print(item)

if __name__ == "__main__":

 main()

This will do the job, use a list of emails in a file "emails.txt" in the same folder as the script, run
python3 [name_of_script.py]

Insensitive sort alphabetical

lolwtf - June 23, 2019, 10:48 am

This will do the job as well LOL.

Code sort -t@ -k2 mails.txt
