Thread: [Account shops](#)

0xc0de - July 3, 2019, 5:07 pm

How do people make account shops with like hundreds of different platforms. Like netflix,spotify,brazzers,... do they just bruteforce accs?

orristur - July 3, 2019, 7:55 pm

They get e-mail login/password lists and then check to see if any of those combos work with a particular service.

F11 - July 4, 2019, 1:43 am

They use sites that to me seem like a simplified shopify. I think it's easy though.

selly.gg
shoppy.gg
rocketr.net
at.shop

at.shop I think his questions isn't what platform does the vendors use, but how they get the accounts.

Oh ok. Whoops. lol

Super - July 4, 2019, 9:10 pm

They use a technique called "credential stuffing" to crack the accounts. Basically, they find public database breaches and reuse the credentials to get into other sites. This is the exact reason you shouldn't use the same password on multiple websites.

As for the software they use, usually it's something called Sentry MBA, which is a multithreaded HTTP based cracker.

OB? I've never heard of anyone using that software.

I have multiple colleagues that own account shops, all of them use either Sentry or custom Python+Selenium scripts.

they must all be selling outdated site logins as they only cracking sites without SSL certificates which only 374343773 sites have SSL certificate.

You have no clue what you're talking about. Sentry works just fine on HTTPS connections (which is TLS now — NOT SSL).

-1 for you, stop posting trash everywhere.
