SS7 is a set of protocols allowing phone networks to exchange the information needed for passing calls and text messages between each other and to ensure correct billing. It also allows users on one network to roam on another, such as when travelling in a foreign country.

I can provide SS7 and DIAMETER access. Let me know your requirements and will need to confirm whether you can afford the access given this is a closed and highly guarded network.

Contact me at [deleted] as I can provide all different attack vectors currently known for SS7 and DIAMETER. Plus I have SS7 access at present, will have DIAMETER access in a few months hopefully. Let me know your budget and your requirements.

ss7 is full of exploits due to its age etc but the main problem is not exploiting it. the problem is gaining access to exploit it in the first place.
