Thread: [I need help on trying to learn how to pull ipa but not ddos or boot](#)

???#5181 - July 23, 2019, 10:26 pm

I need help on how to pull ip's.

I don't plan to boot or ddos but to try to learn how to pull.

I don't want to be that one guy but mess with people and stuff

You need to be specific, what kind of IPs you want to pull?

Website IPs? Or user IPs?

For website IP's the most basic state command you can use on your terminal is "ping [www.website.com](#)", it will reveal you the website IP if it does not have any protection over it. If it does, you will need to use a resolver, which the internet is abundant about, just give it a google search. This are basic tasks for your level which you can do pretty easily.

If you wish to grab user IP's, it's a different story. You will need to be able to make the user "touch anything" that you want him to touch, for instance an URL tracker or my software (Device Tracker, which you can check on my threads). Other than that, if the user has Skype or any other social communication which has available resolvers you could use that aswell. At last resource you will need to do some Social Engineering.

Do a bit of research. You could create a link that logs his IP, a stub (.exe file) using a stub creator, etc. A lot of Social Engineering is included in pulling an IP and just hacking in general from my experience. As I said, research is key with this! There are threads, articles, .txt files, PDFs, eBooks and heaps more out there that can tell you how to do this.

Edit:

Just realised this was posted three years ago ;-;
