Thread: [Wifi adapter Alfa AWUS036NHA and Kali Linux application from Windows 10 app store](#)

MarkBogdani777 - July 28, 2019, 3:31 am

Hello,

I have the wifi adapter Alfa AWUS036NHA, and have installed the Kali Linux application of Windows 10 in my laptop. Now I would like to use the wifi adapter in monitoring mode but when I use command airmon-ng it shows nothing for the chipset. The wifi adapter works pretty well it is brand new, in my laptop works very well for the wifi around recognizes them. It is compatible for Kali Linux but doesn't appear. Something needs to configure or install at Kali Linux on Windows 10 since it doesn't have a default installation like usual Kali Linux. I have made update, upgrade, installed Wireshark, Metasploit, and installed the driver atheros with this command; apt-get install firmware-atheros . Still nothing, didn't work. Does it need something else to install? I would like to know if can I use Wifi adapters like Alfa AWUS036NHA for monitor mode, how? Is it possible with this application in Windows 10 to hack other's Wifi? I have the wifi adapter compatible with Kali Linux for monitoring mode, but when it is used command airmon-ng nothing is shown for the Wifi, anyone can help with this application?

Thank you

This might be because of the virtual machine software you use. Have you enabled USB in the virtual machine software? Maybe it only supports USB 1, but requires a higher version? Some virtual machine systems like VirtualBox require an extension to allow for later USB versions.

If you have fixed that, if you do lsusb, do you see anything?

Check to see if you can add the driver installation disk to your virtual machine. It might require the driver. If not, it is most likely the post above.
