Thread: [Recreate CookieContainer Issue \(Loading from Textfile\)](#)

MalwareMop - August 7, 2019, 2:18 pm

Thread closed. I have figured it out.

The issue if anyone ever has the problem themselves is that specifying a "Domain" is automatically registered as a sub-domain. To add to the parent site you must specify a URI instead. Here's how I fixed it.

```
Code Public Shared Function ReturnLoginSession(ByVal Form As FrmMain, ByVal Profile As String) As CookieContainer
```

```
    For Each LoginSession As LoginSession In LoginSessionList
        If LoginSession.Profile.ToLower.Equals(Profile) Then
            Dim CookieContainer As New CookieContainer
            For Each Cookie As Cookie In LoginSession.Cookies
                If Not Cookie.Domain.StartsWith(".") Then
                    Dim NewCookieContainer As New CookieContainer()
                    Dim NewCookies As New Cookie()
                    With NewCookies
                        .Name = Cookie.Name
                        .Version = Cookie.Version
                        .Comment = Cookie.Comment
                        .CommentUri = Cookie.CommentUri
                        .Discard = Cookie.Discard
                        .Expired = Cookie.Expired
                        .Expires = Cookie.Expires
                        .HttpOnly = Cookie.HttpOnly
                        .Path = Cookie.Path
                        .Port = Cookie.Port
                        .Secure = Cookie.Secure
                        .Value = Cookie.Value
                    End With
                    CookieContainer.Add(New Uri(String.Format("http://{0}", Cookie.Domain)),
NewCookies)
                Else
                    CookieContainer.Add(Cookie)
                End If
            Next
            Form.AppendTextBoxText(Form.TxtChat, String.Format("Setting saved session for
account: {0}...", Profile))
            Return CookieContainer
        End If
    Next
    Return New CookieContainer
End Function
Hope this helps.
```
