Thread: [a local website to execute a local program.](#)

Silent hill - August 11, 2019, 4:23 am

hello hf!

anyone know how to execute any local program using html?

it's like this steam client bootstrap: [example here:](#)

i think there should be a registry key or a running services to execute steam when i click the button.

anyone has any idea? i can tip some \$\$

thanks!

If the program has registered a URL handler you can call it with it's URL Scheme which will launch the program,

Look into URL schemes ([URL Scheme Intro for App Developers](#))

Steam registers it's own handler so you can launch games for example and do a bunch of other things https://developer.valvesoftware.com/wiki/Steam_browser_protocol

Code // This opens CSGO, in your html you could set this as href to an anchor tag or via JS
steam://rungameid/730
