Thread: [Best FUD \(or some\) RAT/Trojan software for beginners on markets? How to infect?](#)

ryanair88 - August 24, 2019, 10:03 pm

Hello,

I have this kind of plan: I want to either

- 1) Infect a computer by sticking a USB stick with the .exe in there (I've heard it being done this way)
- 2) If I infect via USB, does the person need to click on the .exe to get infected or will it automatically load itself on targets computer?
- 3) Send the person a picture wherein a .exe file is also stored (Also heard it done this way and the person wont notice anything) BUT about this option I heard that I need some extra programs which inject the .exe into some .jpg (binder? anything else?).
- 4) Do I need to open my ports and preferably use a clean OS with no antiviruses installed? Does my target also have to have ports open to send out info? (will they interfere? if its FUD like Warzone they shouldnt right)
- 5) Does every RAT have keylogger and passwords extractor from Chrome/FF/Edge? Because these 2 functions are what I need.

--- IF ANYONE WANTS/CAN HELP ME AND GUIDE ME THROUGH THIS PROCESS I WILL PAY FOR YOUR TIME ---

So my questions are:

Can anyone recommend something on the forum or DNM which is really easy for beginners (as in beginner no experience in hacking but well versed in building PC computers, Windows, playing online games, messing with IPs and ports etc) to use and more or less undetected by at least the weaker AV systems. The target which I have probably only has Windows Antivirus or some weak shit like Malwarebytes.

What caught my eye was njRAT 0.8 and Warzone. I dont want to mess around with it many times so I want to get it once and be sure that its a proper good thing because the operation will be instant failure if its detected, I will never have access to the computer again.

I know that njRAT is free and Warzone is \$\$\$ but none of it is a problem for me. I however am afraid that Warzone might be a bit too sophisticated for a beginner like me. I need to set up the .exe file and everything working really fast, like 1-2 days max so I dont have much time to test.

If you also have some tips for a beginner going this route then please fire away.

Hello if you are going to do USB use rubberducky
<https://shop.hak5.org/products/usb-rubber-ducky-deluxe>
(remove space)

Im pretty sure most free rats will have password and keylogger.

open ports? Yes you will need to open ports, I would suggest a vpn to do this. With a vpn it is much

easier to portforward. (make sure to turn firewall off)
this is the vpn I use or just get one that dose no store logs or any of your data
[https:// nvpn.net/order.php](https://nvpn.net/order.php)
(remove space)

also to bypass antivirus you can use a crypter
try lime crypter by nyan cat his is free
