Thread: [Buying charge rate in hack game barely increases charge rate](#)

Nima304 - August 29, 2019, 4:01 pm

I've bought several charge rate upgrades, to the point where my next upgrade costs \$12,160, but even after all of these upgrades, it still says that it'll take 16 hours to get to a full charge from empty. When it says your charge rate has increased by 5, does that mean 5Wh per recharge cycle? If that's the case, given that the full charge is at least 100kWh, the increase is negligible and should be increased significantly (maybe .5-1kWh more per cycle?). Either way, the battery capacity and recharge rate upgrade should tell you what you're getting.

Granted I am a noob, I just buy the recharge packs when I am low they seem very affordable to me.

When it says "5". I think it means decrease charge time by 5mins

If that's the case, it's really low for the price, and should be increased. Either way, it should specify what you're buying.
