Thread: [How to Forward Port -- Two Routers \[Port Forwarding\] Method 2019](#)

Tiger6117 - September 5, 2019, 2:18 pm

In this thread I am sharing my video link of port forwarding, I'll be showing you guys another method for port forwarding using two routers, its basically like how to forward port (double routers port forwarding method).

As we need to access our router in order to forward port but in this video I'll be showing different method as we will be connected with two routers, basically the router to which I am connected is it self connect to another main PTCL router so to forward port from both router I'll recommend to stick with this video.

First I'll access this router and forward port to my laptop mean I'll give router this ip 192.168.10.6 which is my laptop ip, and will tell router to forward any data with port 6117.

Then I'll also need forward port from the main router to this secondary router, so in this way whenever main router receive any data from internet with port 6117 it will forward it to this router, and once this router get the data it will forward it to my laptop. Clear enough, now lets do this port forwarding using two routers.

Detail instruction is given in the video ? [How to Forward Port -- Two Routers \[Port Forwarding\] Method 2019 - YouTube](#)

I hope you will find it helpful, if still you miss something and couldn't understand the method. Let me know in comment section I'll help you with your problem.

With that all been said, I am logging out. Thank you for watching & I'll see you in my next video with more tricks and tutorials.

Good video, although you could have put more effort into this thread instead of copying and pasting the YouTube description.

Also LOL for that typical black and green command prompt.

What's the point in using 2 different routers?

Tiger6117 - October 2, 2019, 7:30 am

No point at all but some users might such situation where they are connected through secondary router. So I made this tutorial to show how they can forward port using two routers.
