Thread: [Bypass Authentication Checks?](#)

Armani24 - September 7, 2019, 1:15 pm

Hello,

How would one successfully login to an account i.e. facebook, gmail, without getting hit with a security check, either sending an email/text to a backup they have on the account. I know of a lot of people who successfully login without these checks, but im not sure how they do it. I know it has something to do with proximity with the target, but I would like someone to get specific on what is actually done for this.

Depends on the service. Try using TOR to proxy to the same state as the target

How close does it have to be? These do cost money don't they the proxies?

The great thing about tor is it's free. As for proximity, that really depends on the service.

Try using legit VPN (Not free). That should work well for you.

i think for facebook the first 3 part of ip should be the same. for example if the last IP Address of the victim is 178.62.7.160 then in order for successful login the first 3 parts of your ip should be 178.62.7
