Thread: [Is there anyway to use a VPN within dedicated server for hide server IP?](#)

__M__ - September 10, 2019, 10:30 am

Hi, I have a VPS server and I am running a scraper here (public torrent scraper), now my server provider giving me abuse report for port scanning but I am not doing port scanning (my scraper collecting torrent info from public tracker), someone suggested me to use a VPN for hiding my IP for scrapping, can anyone please guide me how can I do this?

Anzee - September 10, 2019, 11:55 am

I would opt to use <https://github.com/dgoulet/torsocks> to force your application to make all requests through Tor. It should be enough to hide whatever it is you're doing from your ISP.

Can you please confirm if torsocks work with UDP connection also?

fukurosmc - September 12, 2019, 3:59 am

It cannot do UDP @__M__

"This process is transparent to the user and if torsocks detects any communication that can't go through the Tor network such as UDP traffic, for instance, the connection is denied"

Regards,

Fukuros

Hey mate I suggest you to use a bulletproof server that allow port scanning and torrent or like that. if you interested I can help you .

about port scan on your current server you can close some ports may be it would be better

Tor is extremely slow for this purpose. Better buy a good SOCKS or get a VPN that supports socks. A lot of good VPNs support socks servers.

LordDragon - September 17, 2019, 9:14 am

(Sep 17, 2019 05:07 AM)BullHost Wrote: [\[CITE\]](#) Tor is slow. Use normal VPN to hide your source IP address - like [censored] with openvpn client on your server - or use a hosting with more liberal policy.

Thanks for this

__M__ - September 17, 2019, 9:51 am

Thank you all, can anyone please give me a guide/tutorial for how to setup?

Depending on application, it is probably better to use a socks server. VPNs can lead to connection problems when crashing. Although some providers provide access even if the server is not reachable. But not a lot of providers do that.

If you want to use socks, download Proxifier and add the application to the proxification rules. Then get a VPN which supports socks and you're ready to go. If you decide to go with VPN, then just get something cheap. But be sure that the VPN provider doesn't suck. A lot of providers keep logs and they will ban you for excessive traffic usage.

Zan0n - September 19, 2019, 12:32 am

I think it's better to use proxy within your scraper

Flegy - October 1, 2019, 2:27 am

My suggestion is to use hosting company what allow scrapping. So no need hide IP to avoid suspension.

Can you tell which provider is good? I am using Intel Xeon E3-1246V3, 32GB Ram, 4TB SATA HD for 33 Euro.

It sounds like OVH/SyS/Kimsufi, so even you hide your Server IP... They will still send you this "Abuse Reports".

Its their Anti-Hack System which detects that within your traffic. No need to hide it. They will still see it. Because this anti-hack system is there to prevent such things which are against the tos.

Yes its hetzner, someone give me some iptables rules and told he never get abuse report after using these, for example

```
iptables -A OUTPUT -p udp -s 0/0 -d 192.88.99.0/24 -j DROP
```

Do you think this is right?

I don't know.

It Sounds like your blocking their anti abuse systems. 192.x internal IPs?
