Thread: [My DarkComet RAT doesn't work on some devices](#)

**Regnarth** - September 29, 2019, 4:14 am

Hello,

I've made a DarkComet Rat and decided to test it on two of my laptops. The first laptop is an older one with almost no virus security. The second laptop is a newer laptop with 2 antiviruses. My RAT works on the older one but not the newer one even when i disable all the virus security. I've tried running crypted and non crypted RATs on the newer laptop but it doesn't work. How do I make it work?

Thanks.

What operating system are you using? Remember DarkComet is a very old RAT.

Then do a Google search for "DarkComet RAT Windows 10".

Windows 10 doesn't have all the MSVC libs to run it, I remember a couple of years ago someone else tried it on Windows 10 and it didn't quite work for them either. Why would you not run malware on a VM?

Holy shit I have ranted about this before but just on another forum.

"Why isn't my DarkComet payload working!!!1!111!!!! And I don't care that the RAT itself is older than me it should still work on all systems without flaw!!111111!!1!!!!11010101!!!oneone!one!111!!!!"

This guy probably watched a tutorial on how to RAT off of YouTube.
