Thread: [Reverse Engineer to crack Android Application's API Security](#)

SIM-2059193 - October 4, 2019, 4:59 pm

As the title says, i am looking for a reverse engineer who will be able to crack an android application's API security.

I have commissioned a bot by someone else (due to my lack of knowledge in coding and reverse engineering) which sends requests with parameters to complete actions on the app, it's relatively simple.

The project is currently failing because they have some sort of security (i believe there is required parameters that i do not know how to send). I have researched other people's topics about this and there are several (although slightly outdated) githubs with information and hints regarding this.

I am looking for somebody who is able to reverse engineer the API security and fix the bot that i have so that it sends correct requests. I understand this is vague but all will be revealed on contact, in detail.

Please PM me, i don't know how much this is worth but the task isn't terribly hard. I would prefer if you knew NodeJS but that's pretty optional.

[contract=tid]Start Contract[/contract]

depends on the api. some can take awhile and lot of case testing to reverse, and some take as little as 5 minutes. but you can expect to pay a pretty penny depending on the api itself, and the potential damage or profit of reversing the api.
