Thread: [cant delet pop out winndow on korean website](#)

ALABAMA - October 6, 2019, 7:06 am

hello

this is korea, website

you can not acces to it because asking you have to regester first
and regestration its to hard they asking phone number korean
and why

is ther any way to can remouving this pop out window regestration

this is website

[bunjang.co.kr](#)

Welcome to HF!

First of all...

Don't view the website from the front page. Instead, Google (or whatever search engine you have) for the page you want.

Second, let's get to business!

You have manually delete each part of the web page because it is very dependent on Javascript (disabling Javascript would give you a blank page).

This can be done by using "Inspect Element". I've only done this on Firefox, but I'm sure there are guides for other web browsers ?

Right click on the popup, then choose "Inspect Element":

Then click "Delete Node" for the popup's parts

When all the popup's parts are removed, this is what you get:

Third, and finally

Remember, you're only removing the popup for your computer. You will need to remove it each time whenever you get a new web page.

Good luck!

Did the pics load up?

THX VFRIEND

yes thats work you are smarter one
on chrome but can not scrolle down the page

I'm sorry, I have no experience with Chrome ? Chrome has different functionalities from Firefox

Maybe try download Firefox just for that website, then uninstall Firefox when not needed?

Mizuchi - October 12, 2019, 1:19 am

you can intercept the response with burpsuite too and then remove the code from there

easy huh?

Have you tried it? We could use pics.

Burp Proxy only works out-going, never inbound. If you were to edit the pages in Burp, you'd be better just saving them, and believe me (I've tried) it's not sustainable cos you'll have to clone the website and edit each static link.

Unless you can make a sustainable workflow though, you're welcome to share.

C'mon dude. you'd better to look at intercept options once ://
there is an option for intercept responses and makes everything simple :))

Try it ? Burp's proxy intercept is primarily made for headers, not for source code. Like I said, just clone the website, it's the same result, and would take longer. Why would I get a 300MB program when I can do it in less than twenty seconds? The OP is obviously a customer, not a pentester. I don't think he's willing to learn about an entire framework just to go past a simple popup.

tl;dr It's not easy.

If you have a good workflow, maybe you can share. We're in this thread to learn, not to argue.

agree with you dude ?

ALABAMA - October 14, 2019, 10:42 am

HELLO AGAIN

i tray it on firefox and chrome its work theh pop out singup window gone but can not scrole down the page its stay in same place
is there other solution hackers guys
