Thread: [My SARMS Experience...](#)

shreder - October 31, 2019, 12:50 am

So a while back maybe a year ago I had started going to the gym again so I thought maybe jump start me by getting some SARMS as this "safer" alternative to steroids. I just did a few research into peer reviewed articles and such ended up getting some S4 Andarine/LGD-4033.

First was first week or so I put on a pound of mass or water retention every day for like 2 weeks even though my caloric intake was still the same as usual. Jumping back into the gym in the first time in months I found I was surprisingly strong even having taken a break for 1 year. This must have been the effect of SARMS because recently I jumped back into the gym after another year of break and I cannot do anything I was doing with SARMS. Even with a low calorie diet I was able to put on mass and keep bf% low and be strong. I looked fuller and bigger than usual.

However this wasn't without a draw back my vision was completely fucked, in the dark I couldn't see shit and in the bright outdoors it was super bright. My eyes were fucked and had hard time adjusting to changes in lighting. I also got that "yellow" tint that people said they got as a side effect. I dont recommend anyone taking SARMS too much risk. I might get cancer 20 years from now because of this shit or go blind. Avoid SARMS guys stick with the real deal or better yet stay natural.

Sarms are plain stupid. Not enough research to long term effects, less efficient that anabolic steroids and they will suppress you anyway. Lose/Lose scenario?

Hope you going to be alright OP ?

kpown - October 31, 2019, 11:44 pm

SARMS are not "stupid". They are a great new path of research. One day they could surpass steroids in strength with a lower side affect profile. More time, money and research needs to be put into their development.

Op was braindead and had no idea what he was taking. The vision issues are a known side that comes with S4 use. This is one reason why I will never use S4. There are better alternatives that do not bind androgen receptors nonspecifically. There are androgen receptors in the eyes and S4 is binding to these and thats why the vision issues happen. SARMS are supposed to be tissue-specific in their binding..only interacting with androgen receptors in skeletal muscle cells.

Dont be an idiot and take something you have no idea about @OP

hahahaha "might get cancer in 20 years"

juicyjenitals - November 7, 2019, 8:14 pm

I bought some and they didnt do anything. They were going illegal at the time or something so I bought two bottles that were recommended to go with each other. Since they were shutting down their company I got a deepweb link to a site called BlakSheepResearch and it had a username and

password. Never went to that site.

Well I know mine worked immediate physical effects and my eyes went to shit. Anything that fucks with your eyes is a toxin.

S4 alters your vision because it binds to androgen receptors in the eyes. All other SARMS are much more selective in their binding and will only bind to androgen receptors in skeletal muscle tissue.

Currently for those who run S4, the vision issues completely reverse themselves when they come off. However not much is known about the long term affects on the eyes. For this reason I havent used s4....plus s23 is better anyways as long as youre running test with it.

I dont do anything related with test

Zher0 - November 17, 2019, 2:24 pm

I've had great success with SARMS, never tried S4 though... that's fucked that they bind to the androgen receptors in the eyes. Thanks for the heads up.

dragonHarem - November 18, 2019, 5:15 am

fugg i expected OP amphetamine alike trip report you dissapointed me op also stop sticking sh.it in your eyes please its not healthy you may get blurred vision from that
