Thread: [Simple Malware Distribution](#)

RomanShirokov - November 11, 2019, 8:54 am

Hi,

I am going to simple way to distribute malware using one url.

Important way is bypass chrome virus detection.

First of all you can use sites.google.com and compress malware file with zip.

Then it will bypass.

And you can generate download url from sites.google.com and spread that url using phishing mail.

If you have a another opinion let me know.

I'd be more worried about other antivirus that will detect your stuff once it decrypts. Windows will have other antivirus too.

A simple way to bypass a lot of antivirus is to encrypt the payload and decrypt it in memory only.

Yes,

you are right.

bypassing all antivirus is so difficult.

so easy way is payload will work at only memory.

but several antivirus detect all.

in this way how can you do this.

crypto_horse - March 12, 2020, 4:33 am

i can bypass chrome detection for you.PM me.

faxxgrid - March 20, 2020, 11:14 pm

Could this method work for bitcoin stealer 4.3. Someone gave to me but refused to show me how to use it when he couldn't get his selfish ways

\Hey Roman I really need your help. I got a malware from a mate who now refuses to teach me the following -

1. how to compress the malware
2. generate a url/phishing page
3. method of spreading

can you or anyone help me?? I will donate to any charity of your choice ??

Best option is a simple PNG exploit

Or a mLnk exploit... if you don't know how to inject a malware in image.
