Thread: [How to bind .exe in a .jpg?](#)

William Yeung - November 14, 2019, 8:25 pm

I have written a virus using C++ and compile it as .exe.

I want to bind it to .jpg and send it via email.

How to bind the exe with .jpg so when others open the .jpg, the .exe runs?

You dont. Buy a .doc or .pdf exploit.

vimlaa - November 14, 2019, 8:41 pm

where can I get a good .doc or .pdf exploit

You can't use a .jpg, but if you're up for an image file, you can inject stuff into .svg files and (hopefully) manage what your .exe does

Use a polyglot image or alternate data streams but execution will be an issue.

Agreed, you can make the perfect injector or the perfect image, but there's no point if your target doesn't run it.

i have seen videos of .jpg that when opened,it runs a rce. However,i do not have personal experienced with the exploit builder becauser they are expensive. Maybe another member with knowledge can give more information.

regards

How to bind the exe with .jpg so when others open the .jpg, the .exe runs?

you can search about it on google easily.

well gmail will not let you send the virus anyhow combined with anyother file..

however, you can try different file binder.

only those file binder will work which are not detected till now by anti-virus companies,

otherwise you have to use a crypter and most crypter doesnot work

because anti-virus companies keep an eye on them and already added a fix to ther anti-virus..

otherwise you can try to edit hex values of the crypter to make it undetectable...

somehow, just do some research

otherwsie buy a good paid one from some reliable person..

i do have one

I think I remember being able to use a special character to reverse the name of the file. So you'd use like gpj.egami.exe with the special character turning that into something that looks like exe.image.jpg
