Hi, I have a question because for some time I have been trying to make a script using bf4 and requests through which after giving the url from githuba downloaded this package for me ??? . Something like git clone on linux only made with code and not a command if someone would be able to send some link or direct code I would be extremely grateful ?

....

Why?

Just git clone or use a git library

cant you just curl the zip?

Code curl -LO https://github.com/[github-id]/[repo]/archive/master.zip

Code curl -LO https://github.com/[github-id]/[repo]/archive/master.zip

And with that call it via

Code import os

os.system("curl -LO https://github.com/[github-id]/[repo]/archive/master.zip")

You could use pygit I think it's able to do it.

**Kallu609** - November 26, 2019, 6:42 am

I wrote you an example that doesn't depend on curl and uses Python3 standard library, hope you can learn something from it.
