Thread: [First time Hacker, help me](#)

HackM1999 - November 26, 2019, 4:17 am

Hi guys, i like programming and things that affect pc. I know some programs language like:

- C#
- C
- C++
- Java
- Php
- Html
- Sql
- Mobile app
- Basic linux commands
- i know basic things like IP, IPV4, IPV6, MAC address
- the net structure (firewall, router, vpn, tcp/ip)

I want to upgrade a little my skills and start a simple hacking like install script in background (no .bat please... are useless).

For now the best thing that i did is an android app totally hidden that every 2/3 min turn on the GPS, send the location to a PHP page for save the location and after it power off the GPS (i used it on my mom's for only for try).

NEW UPDATES

This was the message of my first post and after 1 year i'm at the same point so lets upgrade my skills.

Now i my ideas are more clear so, for start i decided to learn:

How to hack an IP cam (the IP cam is mine, i bought it only for this)
I want to create a rubber ducky Usb and after understand well the code
Try a keylogger and after develop my own
Try a RAT (on my pc) and if is not too hard i want to develop it
Try to get a wifi password and develop the software
Develop a Brute force software
Something for Android, now i don't know what
Learn Kali linux

For start i think i will start with the IP cam or with the rubber ducky.

If someone have a guide, or a tutorial or can help me i will be very happy

ernestmiller - November 26, 2019, 7:55 am

I remember my first time... :p

it was actually yesterday

"How to hack an IP cam (the IP cam is mine, i bought it only for this)"
Well kali linux is your best friend or parrot OS. Scan the network and find the IP for it, then try connect to it via web browser (try default passwords and usernames for that make and model) if no luck, brute force it with hydra or other tools.

"I want to create a rubber ducky Usb and after understand well the code"
There is plenty cheap ones to buy (with wifi too!) and easy to program, they can be programmed to add a user on the machine, add a shell, email screenshots and keystrokes, email all info on

machine, email wifi passwords, steal browser history and logins saved (email and passwords) and much more .. I own Hak5 rubber ducky and bashbubby both fun to use.

"Try a keylogger and after develop my own"

Plenty opensource ones out there to try, compile your own with edits or use the previous question and use a rubber ducky to plant the keylogger on the machine or disguise it as software and send it to whoever.

"Try a RAT (on my pc) and if is not too hard i want to develop it"

Again plenty opensource software there and rubber ducky can plant rats same as bashbunny or send links to the malicious keylogger for victim.

"Try to get a wifi password and develop the software"

Once you have access to the machine this will be easy, if not refer to rubberducky or bashbunny or other methods such as kali linux for hacking/cracking wifi - eviltwin, wifite, reaver, bully and so forth

"Develop a Brute force software"

Can do this with kali linux - plenty tutorials on YouTube and Google.

Good luck my friend and enjoy the journey

Thank you very much!! i will start very soon to learn

For the Rubber Ducky and Bash Bunny what are the differences?

w1l5t3r - November 27, 2019, 10:55 am

For the Rubber Ducky and Bash Bunny what are the differences?

rubber ducky = you can disguise it as a flash drive, load files (payloads) on SD and hide the partition so when victim loads the drive it shows photos, documents(whatever you chose to display) while the hidden partition (payload) steals files from PC/Laptop photos folder, documents, and wifi info along with browser history, saved usernames and password while infecting with a java snooper (plenty there that run undetected and email you screenshots, keystrokes and webcam snaps)

bashbunny = same as above but can host 2 payloads by flipping the slide switch, Fast device that can do much more than keylog, can use as MiTM, Gateway and much more

HackM1999 - November 29, 2019, 3:47 am

Thank you again

I decided to start with the RAT + Rubber Ducky and i found a lot of good RAT the problem is that Windows Defender block the server. After a lot of search i've found that i need a Crypter for Crypt the file but i didn't found a good Crypter, i decide to create mine so what a crypter need to do to create a file totally FUD?? do you have some source code to take insipation?? Or a good cheap Crypter?? i found only 200\$ Crypter.

Thank you guy(s)
