Thread: [How to check it? \(DoS/DDoS attack sniffing with python3\)](#)

4rmaged0n - December 13, 2019, 12:36 pm

Hello Guys ? , I have a Question, do you not know any Python3 module thanks to which after entering the website address you can check if there is too much traffic? I would like to have the URL or any example code.

Have a nice evening <3.

No you can't measure "too much traffic given website address". You might be able to check the page load response time and see if it increased as you send more and more requests.

i mean the closest thing you can do is use the pcap-ng module to capture traffic tht goes through the server (assuming of course that you have access to it) and you can sorta get an idea to what is going on. You can find it on pypi i cant post link because my account is new.

You can have an estimation of network traffic by using third parties service that uses different kind of factors (i.e. <https://www.alexacom/siteinfo/google.com>) but you should not trust it too much.

You need the access log or the information generated by the analytics tools used by the company to have error free data.

You should also clarify what is the meaning of "much traffic".
