Thread: [Doesn't iOS count the battery percentage ?](#)

Stephanie Medlock - December 20, 2019, 7:12 am

I have an iPhone X, which is on iOS 13.3, which battery is at 97% capacity. I mostly charge my phone to 85% or 90%, after recharge my phone I reboot it and battery is standing at 95% or 97% if I recharge it to 90%, and if I charge it to 85% then it's on at 92% or something after reboot...

If I use cellular data, battery drains like hell, like I watch YouTube from 4G it drains 35% to 40% in half an hour, after watching a half-hour video I reboot it then iOS give to me 20% more battery life. And if I don't reboot my phone, the % is stuck...

ClemHarvey - December 23, 2019, 5:11 am

There are countless times where I'm using my iPhone X and happen to glance at the percentage and realize it's way too low and I'd better charge it - frequently at 1%. Apple has forced me to be Buddhist and not grow attached to material things... :(

So be my guest, the time is there on the Home Screen, Apple has proven that it is possible to display a number in that space. Why not:

- 1) Alternate time and battery percentage in same space where time is displayed.
- 2) Alternate battery icon and percentage in the battery space.
- 3) Let someone create an app that is simply a home screen icon that shows the battery percentage in the icon, and updates says once a minute.

We do have tons of tips on iPhone battery draining issue, but this initial Battery percentage made by Apple just cannot delight me.

Best advice ever.

@OP,

Do as ETH suggests you, because they can calibrate the battery for you and check it with a system to see if there are any flaws.

If you wait too long and the warranty is over, you will pay a big price to get it fixed.
