Thread: [Corrupted Hard disk](#)

Quality_k1nG - December 25, 2019, 1:35 am

Hey Do anyone know how can I repair my hard disk

I has more than 500GB+ of data I tried to use free tools but they are limited to recover only 1 gb of data

So the thing is hard disk is not showing in my computer , so Can't access any file, I guess the partition is corrupted and the hard disk belongs to my friend.

I tried using some linux tool but they are all getting stucked in the process

Can anyone help me in this case?

I really it need as it contains the valuable data.

thanks in advance.

If the data is important, and the software demos have shown that you can recover data (even though just 1GB), go ahead and buy the software. Don't be cheap, if the data matters. This kind of software is not that expensive.

For recovery

<https://www.cgsecurity.org/wiki/TestDisk>

For Disk Repair

<https://gparted.org/>

Try both tools mate and they're OSS

Hello buddy,

Be aware that Data recovering from experts can be pretty expensive, in my opinion you should first buy the full software version if it allowed you at least to recover 1Gb, it could means you can retrieve the remaining.

Without Buying We can use Open source it is far better than expensive software

I appreciate your help very much.

If I could have purchased then I would have.

Thanks for the software , I will try those.
