Blog? Did you mean username.wordpress.com? This is not possible due to secure wordpress high-level security system, the only attack method that you can practice are bruteforce and social engineering.

but If you want to hack wordpress normal site (CMS) *usually using TLD domain not using *.wordpress.com, there are a lot of vulnerability on <https://www.exploit-db.com>

no i meant blogs hosted on their own hostings using wordpress as cms. not wordpress.com

how to do it with the site u gave me?
