Thread: [Bypass Cloudflare antibot protection for scraping](#)

UKevin - January 14, 2020, 8:13 am

Is there any framework out there to do so?

Invisible - January 14, 2020, 12:28 pm

I would checkout [puppeteer-extra](#), it's a wrapper that has addons that makes it harder for websites to detect bots. I haven't used [puppeteer](#) for web scraping, but for other various tasks.

I would highly suggest using something such as [cloudscraper](#), I have used it before and it bypasses Cloudflare on any website using javascript. It also acts pretty much like normal requests as well making it easy to use.

I second this. Cloudscraper has been a very useful and effective module for me several times.
