Thread: [Python Account Checker](#)

Symph - January 15, 2020, 12:52 pm

Ok, so I want to learn how to make an account checker. The main issue I have is finding out the POST link along with the headers that I need to send the account info to. I am going to start off with Spotify. It's been done a million times but just want to try and learn the basics of it. Anyone able to give me an example of a account checker made in python or even help me out with finding the link I need to be sending the account info to. I understand trying to find it with the dev tools using the browser.

Are you just looking to validate usernames? If so, simply do a request to "https://open.spotify.com/user/{username}" and check the status code. 200 means taken, 404 means it's available:

Redirect happens if you put uppercase in the URL

I don't know if this is allowed, but I was Ideally looking for an account checker like crack accounts. Runs a combo list and tries to log in to the accounts.

I think the login only requires captcha from using the website. If you use the API to log in it doesn't need a captcha or if set the user agent to an iPhone it doesn't. As I know that's how they are made. As there is proxy less Spotify account checkers out there.

If you can learn,

HTTP/HTTPS
Network
Python requests

You can do it within max couple hours. Most website protect their back-ends i can also recommend selenium library. Check github for source codes there is tons of it.

@Goodies; miss you welcome back (:

@Goodies; miss you welcome back (: Thanks for the reply, I know a little bit about python-requests about sending data as well as receiving data. I will take a look at Github now aswell!
