Thread: [Why people mistake brains for souls?](#)

JustDevyThing - January 17, 2020, 2:51 pm

like man, your whole consciousness, subcosnciousness, personality, thoughts, everything is in BRAIN, not in soul

why so many people mistakes brains for souls? and why do they think they will live for eternity if their soul goes to heaven.. once your brain is dead, its over.

even if there was some magical religious entity like soul - your soul wouldnt be you, as youre your brain. if soul leaves the body (assuming soul concept is real) then it means brain is dead.

if brain is dead then you cant see, think, feel, breath, and your personality and thoughts are gone as well

why people so carelessly throw words like soul and mistake it for brains?

Proxy God - January 17, 2020, 2:55 pm

I was having this exact thought either earlier or yesterday. I don't think your brain is as important as your soul. As in your soul is there when you're dead and lives forever. Your brain is just your temporary reality of this shit, to help you navigate through this.

JustDevyThing - January 17, 2020, 2:56 pm

Imao bro theres no such thing as soul and you will not live forever. sorry to burst your bubble but theres literally ZERO evidence of souls and eternal life.

There is evidence of God, I have felt him. But sorry to burst your bubble, you atheist skid, I don't care about your replies anymore.

"you atheist kid" xd lol.you havent felt him bro. you must be trolling/lying

Graybyte - January 17, 2020, 3:06 pm

People just cling onto whatever they can understand. The idea of a soul is a lot easier to latch onto than trying to understand a brain. I see what you mean, and somewhat agree. But I think there is more to our lives than a brain.

What's with all these "deep threads recently? Do you guys figure you sound like Einstein or something, and that your thoughts are something revolutionary? You sound like Stephen Hawking, and I don't mean that in a good way.

Except that they're not deep, and that there's no real substance behind what you're saying.

i say that majority of people believe in existence of something that wasnt yet proven. youre saying im wrong?

And the same goes for religion, but you don't see me making threads on my grandiose ideas. You're just repeating what billions of "smart" people have said before.

and they keep repeating it because the masses still believe in imaginary and unproven concepts

I think the idea of people having a soul is much less damaging, and in fact makes people more human, than religion. Why bitch about something innocuous that doesn't hinder you in any sense?

Nate - January 17, 2020, 4:12 pm

I like the idea of a functioning brain then a soul

Deany - January 17, 2020, 4:16 pm

Because it is their way to cope with death.

Pawnhub - January 17, 2020, 4:50 pm

If the brain wasn't the source of consciousness brain injuries wouldn't effect people like it does.

Anything from alzheimers and dementia to amnesia and memory loss effects consciousness.

I'd say that's a clear sign that consciousness does indeed come from the brain not a soul.

Pawnhub - January 17, 2020, 10:22 pm

(Jan 17, 2020 08:18 PM)phantomman55 Wrote: [\[CITE\]](#) soul is real but think of it like brain is your computer's hard drive this is same for body. it stores physical data. soul is the software side and think of it as an emulation of a hard drive. it emulates it for brain and stores energy in another dimension of this universe.

So, think of it as the physical brain is your primary hard drive and at the same time your soul is your secondary hard drive that's uses as a backup but it's at another location at the exact same time.

The physical brain stores data and that data interacts with your souls energy. Google ghost particle. There's enough evidence to prove we have a soul and we know every little how our universe works. Ghost particle is proven to exist but at the same time physics cannot explain as to how this particle can exist and behave that it does. it breaks all laws of physics. So, we are current keep rewriting physics.

Which ghost particle? The one at cern? or the one in the antartic? Cern never confirmed theirs yet and along side that it's not anywhere near the human body.

It's like finding a proton out of place when looking at a decayed atom on a rock. "there's the human soul right there"
