Thread: [Malware analysis](#)

InteNt - January 20, 2020, 1:07 pm

Does anybody have helpful information when it comes to malware analysis? There are sites like [valkryie.comodo](#) and [virustotal](#) that help analyze potential malware. For me it's hard to distinguish and separate for instance a keygen an actual malware. Can someone elaborate some helpful tips on how to distinguish the difference between a clean program and an actual malicious program through these analysis websites like what to look for?

Like for instance how would you go about looking for clues on a file like this

https://valkyrie.comodo.com/get_info?sha1=caad125358d2ae6d217e74cfd175ac81c43c729

Hello buddy,

In order to see if a program is malicious or not, some websites can help you like those you mentioned. Here is one more : <https://www.hybrid-analysis.com>

However, if we talk of real malware analysis it means to decompile the source code of the malware, so it means that you should know C languages (C, C++, C#) and Assembly can be useful too.

Can you do this on python programs aswell?
