Thread: [Intercept and analyze data from the webserver](#)

MRD_ - January 20, 2020, 6:18 pm

Good evening everyone

I am looking for a way to intercept and then simulate data that a website sends to the server.

On the page I have to fill out some data and then press "submit". Then I come to a website with a QR code that is generated.

Now I want to intercept the data that will be sent after I press "submit". Then I would like to send this request to the server myself at any time without having to enter all the data beforehand.

Is that somehow possible?

On the page I have to fill out some data and then press "submit". Then I come to a website with a QR code that is generated.

Now I want to intercept the data that will be sent after I press "submit". Then I would like to send this request to the server myself at any time without having to enter all the data beforehand.

Is that somehow possible?

Hi MRD,

I'd recommend using Burp Suite for this. You can intercept and modify requests, it also offers a lot of other functionalities.

Search on google how to configure Burp Suite with firefox and you're ready to go.
