Thread: [Windows10 FUD Backdoors](#)

psickophant - January 27, 2020, 6:49 pm

Yes,
I am fairly green and am looking for information on FUD Windows 10 backdoors that bypass windows defender. I have utilized a bunch of Backdoor Generator, and several custom scripts to get a backdoor (shell or meterpreter). Everything is being tagged by windows defender. I am having trouble finding good information on customizing backdoors to bypass. I really want to educate myself on this topic but dont find much help so far. Maybe im not looking in the right place. Its frustration. Will some one give me a hand. Thank you so much.

Have you tried to create your own custom reverse shell? Have you also considered taking the Metasploit templates editing those and then edit and change up the assembly a bit? Look Metasploit and most common tools are very well researched, so truthfully custom is the ticket. Also when talking about the FUDness or DUDness we gotta talk about signing, expensive for some but well worth it.

I suggest you really sit back and learn about Defender/SmartScreen/AMSI learn the security products it is massively important.

Thanks for the reply. I am excited to learn about the topics. I guess I have just been fairly frustrated and needed to take a breath. I will certainly be delving into windows defender and antivirus evasion. If you may know some specific sources for this information it would help greatly. The more I learn about pentesting the more I find that I dont know.
