Thread: [Accepting Bitcoin with IPN](#)

citsejaM - February 3, 2020, 3:16 pm

Hello,

A bit tired of this honestly, rocketr has KYC. coinpayment has KYC. what doesn't have kyc nowadays?

Anyone have any suggestions for a payment processor that allows me to accept bitcoin with an API(to return address & amount, no ugly checkout link) and IPN callback(automation)
Please let me know.

Run your own server. You won't get big enough for anyone to put KYC pressure on you

I've had a look at BTCPay Server but they use checkout links/form similar to Bitpay/Coinbase. No API, what do you recommend?

You can easily create an IPN inside of it

Any major company that process BTC is going to have to follow KYC.

HF uses BTCPay. I coded the changes for it a couple weeks ago. API does exist. IPN callback exists.

Try it out on HF. <https://hackforums.net/buyawards.php>

Once you choose the award you want a popup appears with the BTC payment information. It is a live-updating modal popup. We chose the modal popup instead of full page redirect just because we want to keep everything on HF. You control the BTCPay server URL so you can always have it on site anyway.

Once it hits our confirmation settings (configurable in BTCPay) then the BTCPay server messages HF.

You can query the REST API directly or use a library in a multitude of languages, including PHP: <https://github.com/btcpayserver/btcpayserver-php-client>

EDIT: Now that we set up BTCPay server for HF we have the possibility to offer Vendor features just like this.

When?

Tell. Me. When.

I hate tryna match people to their contract. Plus that fee is kinda annoying with CP.

I ended up using "apirone", it is basically blockchain receive api but then public and no gap limit.

Pretty nice
