Thread: [1900 text files, need to import into db](#)

DivineProgramming - February 9, 2020, 12:49 pm

Title pretty much says it all.

I have about 1900 .txt files ranging from 120.0000 to 2 million lines each. They all say the same thing about a game character, but the structure is different.

Example: they all contain ID, playername, player item a to z and experience

But for somehow in a different order.

Any ideas?

Charger - February 9, 2020, 12:52 pm

Split the files into smaller sizes first off.

I can help, but you need to post a few lines of each.

The mysql database is a remote connection.

If you could help me with just email:password then that would save a lot of time. I could just upload the gamedatafiles manually.

Do you have API's for that, or just a bare mysql connection?

Would you be able to provide a little more information, please?

For example, can we see a couple of the different structures that you mention?

DivineProgramming - February 15, 2020, 12:56 pm

I wrote a python script for this. Thanks for the tips though
