Thread: [CloudEye/DarkEye vs Broad vs Trillium](#)

Dafuq - February 14, 2020, 1:24 am

If you use or have used any or all of these, a little info on which one is better and why would be appreciated. ?

I am in the market to buy something that works irrespective of the RAT being used, however, I am currently testing with #. ?

Your thoughts? ???

SheSmokes - February 14, 2020, 2:15 am

I've only tried DataPro and CyberSeal from this market, both which were good. The suggestion I will give though is this, # runtime detection rate is pretty bad.

I know what you're saying. But I know for a fact that it is possible to bypass AVs if the crypter stub is FUD. This question is just to get people's thoughts on various options available. I am only considering the advance crypters now, since the basic ones didn't work for me. Thankfully, the owners were nice enough to issue a refund. ?

darkeye is well known crypter since years

but u cant judge its runtime

as they turn into memory downloader

something like what nayan cat send here on his great share

<https://hackforums.net/showthread.php?tid=5872839&highlight=memory+downloader>

what darkye do is download the main .bin from internet(with no drop on disk)

then directly map it on memory

from samples

they have 2 injection type

self injection(detected as runpe) if u use runpe detector

system process injection is cool with no runpe detect

to know its true runtime u must do dyncheck while internet is on

as if u do normal dynncheck(internet of) you do nothing as you only excute there downloader

that try get the main .bin from internet to map on memory

Prices are so expensive(greedy) with no new idia to push on market

only repect those coders here cyber coder and n0\$f3ratu\$ with there big knowlage

broad crypter i think is dead

Does DarkEye get the job done? It seems to be bypassing windows defender without any problem and even if the RAT is detected and removed, it comes back online after restart. ?

FuzzyInteger - February 18, 2020, 8:51 am

CloudEye (darkeye) with trusted loader (system process mapping), bypass almost everything. ?

smtsky1st - April 24, 2020, 3:22 pm

I have this hash identifier issue with my CloudEyE.

Anyone know how to rectify this? Or is anyone else experiencing the same?
