Thread: [Need Help Using ManyCam with Nox/BlueStacks](#)

artyhack - February 21, 2020, 10:49 pm

My goal is to use some VCW files to hit people up on apps like Azar and Holla (since that's where everyone seems to be on these days, instead of Omegle and Chatroulette anymore). But I have not been able to get this set up to work. I installed the newest version of NoxPlayer, but it won't recognize my version of ManyCam (4.1.2.3) or my webcam when I plug it up. I assume Bluestacks is the same problem.

How can I get this or another fake cam software to work with in an android emulator and these apps? Was just about to come here and buy some packs before I got stuck.

ManyCam isn't built to work in VMs. You're gonna need to find a program that acts like ManyCam and can be downloaded to your emulator.

How I found this forum is Google searching this issue, and some older threads said one of the advantages to using Nox over BlueStacks was that it detected the ManyCam source. Is there no other info on that?

To be fully honest VCW is really tedious work for the amount of money you'll be getting. I'd suggest finding a niche within ewhoring and sticking to typical methods like snapchat/kik etc
