Thread: [My website has been getting hit with a NTP attack for more than 24 hours](#)

Herion - February 24, 2020, 1:04 pm

Server has been null-routed however is there anything I can do to stop it? In the past attacks would always last for like an hour max and after a server restart we would be all fine and well. However this one is something different and has contentiously been hitting our server with sometimes a random peak. I do have a VPS at [censored]. If someone has any tips, please let me know!

Cyber Rick - February 24, 2020, 1:17 pm

Not much you can really do besides get a better VPS/one with DDoS mitigation or request a new IP (if possible). Lmk if you're interested in switching providers.

Sickness - February 24, 2020, 1:19 pm

I recommend you having a look at [hostlick.com](#) , great anti-ddos and great dedicateds.

Herion - February 24, 2020, 1:20 pm

But how the hell do they have the resources to keep going for like 24+ hours now, ain't that really heavy?

nah i dont think you need much, how much bandwith you got on your port?

mrjammy - February 24, 2020, 1:35 pm

im just wondering why your not using CDN ?

Shisho - February 25, 2020, 4:07 am

You'll have to switch the public IP to a fresh one by adding a new one to your [censored] server and configure it using the out-of-band console then delete the old IP so it isn't routed to your server anymore. Hide your site behind something like Cloudflare or else risk staying down.

SpackHost - February 25, 2020, 11:01 am

Just go under cdn, if you can use cloudflare or other shit, use it. or change hosting, gamehosting.it is the best for ddos.

Kind regards
