If my sens is 3.5 and zoom sens 0.8

If i decrease my sens to 3.0, what should I set the zoom sens to make it feel the same as on 3.5 ?

C2B41T - March 2, 2020, 3:29 pm

My zoom sens is the same as a normal one, when you get a feeling does it matter?

Menalix - March 2, 2020, 4:23 pm

Zoom sens is already a multiplier function of your current sensitivity

so on 3.5 it is 0.8 $3.5 = 2.8$

and on 3.0 it is 0.8 $3.0 = 2.4$

both a 20% reduction of your normal sens.

if you want it to stay at 2.8 when using 3.0 sens then your equation to figure out the right zoom sens will look like this:

$x \cdot 3.0 = 2.8$

$\Rightarrow (x \cdot 3.0) / 3.0 = 2.8 / 3.0$

$x = 0.9333\ldots$

So if you want your zoom to feel exactly like it was before put it at 0.9333

If you want it to feel like a 20% reduction of your normal sense, keep it at 0.8

If you decrease your normal sens I would keep your zoom sens as is, your zoom sens should always be slightly lower than your normal sens imo.

Personally I use 1.0 as zoom sens. What are the benefits of a slower sens for zoom? It puts me off.
