Thread: [Keep getting suspicious activity alerts when making burner facebook accounts](#)

armstrong3066 - March 2, 2020, 7:35 pm

I keep getting these suspicious activity alerts that prompt me to enter a phone number and submit a photo to verify my identity. How can I get around this? I've tried doing it with and without a VPN and also clear cookies and cache before attempting. any tips would be great. thanks

I haven't tested this but I would recommend that you try this as a possible solution.

This requires a bit of investment but will make you look like a residential desktop user.

For the sake of the explanation I will use "US" as the desired country to appear that you are originating from.

Things you will need:Residential private proxy that isn't on any blacklists and is static and not rotating.

VPS with windows installed along with google chrome
proxifier or a program that will proxy your browser and prevent leaks.
a physical phone number (not virtual) that is from US.
a gmail email (use physical sms to obtain a gmail email
photos that weren't grabbed off of google images that appear to be of someone. (possibly manipulate the image to avoid any facebook fake photo detection matching one on google images.

1. Get a windows VPS with cryptocurrency
2. Install chrome, proxifier on vps
3. Proxy your chrome with the US residential private proxy (and make sure the IP never changes)
4. Register a google account with the physical number (US number) and then register an facebook account with the @gmail email and the physical US number. Act like a normal user for the first couple of days. Post pictures, Join harmless facebook groups (vegan, painting, etc). participate in innocent conversations in facebook groups and befriend random people to build a believable friends list. and then age the account quite a bit before using it for whatever your purpose is.

Only other thing I would add is try to have typical sign in times for someone within that country and possibly setup an android emulator for the instagram app to generate some traffic on there as well since its owned by facebook.

If you are using public proxies they will flag you right away and lock you out.
