Thread: [Windows 10 BSOD on startup](#)

fidusobe - March 6, 2020, 10:29 pm

Whenever I boot up my SSD, I keep getting System_Service_Exception error.

Things to note

- 1.SSD is brand new and just installed yesterday
- 2.PC is about a year old everything works fine on my parents page no bsods etc.
- 3.I am on 1809 winver 17763(same as my parents page)

I just cant figure out what is the cause of this issue as it only seems to happen on my end anyone here who can help me?

Hello buddy,

Are you able to reach the system and then it randomly crashes or does the BSOD appears before ?

Are you able to go to the option boot menu and run in safe mode ?

If the SSD is brand new so the issue would be due to the drivers. Have you updated them ?

When I installed windows a few days ago, I didn't experience any bsods. Only the next time I turned it on, the error occurred but so far no bsods on startup ever since. I have not runned it in safe mode yet, I might do it if it happens again.

Did you do all your system updates? Any chance you shut off the computer during an update?

Since it's that fresh, I'd just reinstall Windows. No point in going through all this work.

Next time you reinstall, initial boot let windows update for about an hour or so. Restart when they're done and check if there is any more updates. It's pretty important to Windows 10 that these are completed. Provides an optimal Windows experience.

Maybe reinstall windows without ethernet plugged in.
Once you are in windows plug it back in and start on updating?

Yes, if something is installing and you start installing shit as well.
There is a small chance things go badly.

Yes and make a proper system restore without any cheats or something.
I see u are interested in cheating, don't install "free cheats" because they are made for other purposes then help u.

Well I don't use free stuff its just that when I cheat on games like fortnite some tools kills certain functions e.g. system restore, resetting pc etc.

Shouldn't be like that, no cheat can make ur pc less secure, or it's a badly made cheat.

Not the cheat more like the spoofers/cleaners hard to find one which doesn't kill certain functions.
