Thread: [Protect Wifi and IP from hacking](#)

SIM-4620721 - March 18, 2020, 7:21 am

Dear Experts,

I want to know some information about protection from hacking of WiFi and IP tracing etc.

1. What is possible way to protect WiFi from hacking?
2. Is there any way to check if WiFi is hacked or not?
3. Can hackers easily hack WiFi from just its Particular name?
4. Again is there anyway to protect IP from stealing?
5. Is there any software to check IP protection condition?

Thanks

If its your home network, there are many things you can do. SSID disabling is a favorite method of mine. It essentially hides the name of your network, so when people scan for Wifi to use yours wont come up. If they even know it (you'd be the one giving it out) they'll have to enter it manually. Same goes for the wifi key, etc. Some older Wifi Routers still have old encryption standards in place like WEP. You'll want to change this to something better like WPA2. Vulnerable management frames and deauthentication attacks can be a pain, so look into the 802.11w IEEE standard. Make sure the default username/password for the admin maintenance panel on your Router is changed to something secure as well. You can beef up your firewall security standard. This topic can get pretty broad.

If you're on a public wifi there's really no way to tell if it's 'been hacked' however you can use VPN software to make sure your traffic stays encrypted. If it's your home network you can login to your admin panel and view the connected devices. You can block any ones you dont recognize.
